Music theory

Western tonal music is governed by rules:

- What notes sound good together,
  or in sequence
- How voices should interact
- How a piece should be structured

Learning and following rules requires
care, attention, and time

Mezzo

A Haskell EDSL for music composition

Maintains a static model of music

A dependently typed music algebra

Converts composition mistakes into type errors

Compiler errors describe the nature and
location of mistakes

Behind the scenes

Where GHC 8 comes into play

Problem: keeping a size-indexed matrix on the type level requires GADT promotion

Changed 21 months ago by Richard Eisenberg <eir@…>

In 67465497/ghc:

```
Add kind equalities to GHC.

This implements the ideas originally put forward in
"System FC with Explicit Kind Equality" (ICFP'13).

There are several noteworthy changes with this patch:
 * We now have casts in types. These change the kind
   of a type. See new constructor `CastTy`.

 * All types and all constructors can be promoted.
   This includes GADT constructors. GADT pattern matches
   take place in type family equations. In Core,
   types can now be applied to coercions via the
   `CoercionTy` constructor.
```

Where GHC 8 comes into play

Problem: keeping a size-indexed matrix on the type level requires GADT promotion

Solution: upgrade to GHC 8!

With GHC 8, GADTs can be promoted just like any other type

Enabled by the `TypeInType` extension

Domain-specific error messages with
GHC’s custom compiler errors feature

Rules propagate the interval axioms to the pitch matrix verification

```
class ValidMelLeap (p :: PitchType)
                   (q :: PitchType)
instance ValidMelInterval (MakeInterval p q)
      ⇒ ValidMelLeap p q
```

Musical constraints

Constraints connect the pitch matrix with the Haskore algebra

The rules are enforced any time a `Music` constructor is used

`ConstraintKinds` allows us to treat and manipulate constraints as types

Flexible means of validation, such as computed or partially applied constraints

The rule system is extensible and customisable

Constraints are further parameterised by *rule sets*

Rule sets

Allow for customisation of rule-checking

Not all genres of music follow the same rules

```
class RuleSet t where
  type MelConstraints  t m1 m2 :: Constraint
  type NoteConstraints t p  d  :: Constraint  ...

data Classical = Classical
instance RuleSet Classical where  ...

data Empty = Empty
instance RuleSet Empty where  ...
```

Rule sets

Allow for customisation of rule-checking

Not all genres of music follow the same rules

```
class RuleSet t where
  type MelConstraints  t m1 m2 :: Constraint
  type NoteConstraints t p  d  :: Constraint  ...
```

Music values are parameterised by rule sets

Rule-checking behaviour can be modified dynamically

```
data Score = ∀ rs m. MkScore rs (Music rs m)

MkScore Classical (c qn :-: b qn) ✘
MkScore Empty     (c qn :-: b qn) ✓
```

Advantages of static typing

Static, compile-time verification

Source location of mistakes

Two, distinct views of music

Haskore algebra for composition,
pitch matrix for verification

Simple term-level programming

Disadvantages of static typing

Complex type-level programming

But not much harder than doing
the same thing on the term level

Slower compilation

But time is saved on *finding* the mistakes

Term-type separation

Can be handled with standard Haskell techniques

Musical constraints

Musical constraints are implemented as a series of "inference rules" via type classes.

GHC's custom type error feature lets us specify which instances are invalid, and provide an explicit, domain-specific error message.

```
class ValidMelInterval (i :: IntervalType)
instance TypeError (Text "Major sevenths forbidden.")
      ⇒ ValidMelInterval (Interval Maj Seventh)
instance {-# OVERLAPPABLE #-} ValidMelInterval i
```

Class with no methods – an *open type predicate*. A type is either an instance (a valid melodic interval) or not (an invalid melodic interval).

Musical constraints

Musical constraints are implemented as a series of "inference rules" via type classes.

GHC's custom type error feature lets us specify which instances are invalid, and provide an explicit, domain-specific error message.

```
class ValidMelInterval (i :: IntervalType)
instance TypeError (Text "Major sevenths forbidden.")
      ⇒ ValidMelInterval (Interval Maj Seventh)
instance {-# OVERLAPPABLE #-} ValidMelInterval i
```

If `i` is unified with a major seventh interval, a type error is encountered (uses `GHC.TypeLits`).

Musical constraints

Musical constraints are implemented as a series of "inference rules" via type classes.

GHC's custom type error feature lets us specify which instances are invalid, and provide an explicit, domain-specific error message.

```
class ValidMelInterval (i :: IntervalType)
instance TypeError (Text "Major sevenths forbidden.")
      ⇒ ValidMelInterval (Interval Maj Seventh)
instance {-# OVERLAPPABLE #-} ValidMelInterval i
```

Otherwise, the interval is valid. We need to handle overlapping instances, as Haskell type classes are open and not checked in order.

Musical constraints

```
class ValidMelInterval (i :: IntervalType)
instance TypeError (Text "Major sevenths forbidden.")
      ⇒ ValidMelInterval (Interval Maj Seventh)
instance {-# OVERLAPPABLE #-} ValidMelInterval i

class ValidMelLeap (p :: PitchType) (q :: PitchType)
instance ValidMelInterval (MakeInterval p q)
      ⇒ ValidMelLeap p q

class ValidMelAppend (v :: Voice l1) (w :: Voice l2)
instance ValidMelLeap (Last v) (Head w)
      ⇒ ValidMelAppend v w

class ValidMel (p :: PitchMatrix n k) (q :: PitchMatrix n l)
instance (ValidMelAppend v w, ValidMelConcat vs ws)
      ⇒ ValidMelConcat (v :-- vs) (w :-- ws)
```
